

OPERATING INSTRUCTIONS

1. With the plunger down, insert "Chucks Gold Trapper" into the water, facing the large opening located on the side away from your body.
2. Pull up on the plunger. Water will flow out of the hole on the side while pulling the sand and gold in the bottom. Wait approx. 3 seconds and slowly push the plunger down.
3. Repeat these steps until you have acquired a desired amount of sample. **(Do not remove from the hole while pumping).**
4. After pumping one or more times, pull the plunger all the way and rotate out of the way, using it as a handle, and pour the sample (out the hole in the side) into a bucket, sluice, classifier, etc.
5. A nozzle may be attached for sucking out cracks in bedrock and going between and below large rocks while working a hole. Simply slide onto the end of the "Gold Trapper".

This product is warranted for one year for workmanship and materials (used under normal use).
Manufacturer will decide warrantee.
